## 0003 - Cantilever Beam on an Elastic Pasternak Foundation

## Description

A cantilever beam of length $L$ and rectangular cross-section with height $h$ and width $b$ is lying on a Pasternak foundation with stiffness $C_{2, z}$ and loaded by the distributed loading $q_{z}$. The elastic Winkler foundation stiffness $C_{1, z}$ is considered zero. Neglecting self-weight, determine the maximum deflection $u_{z}$ and maximum bending moment $M_{y}$ of the beam. Calculate these properties for a plate of the same heigth and width as the cantilever, as well.

## Analytical Solution

## Member Calculation

The governing differential equation of a beam on a Pasternak foundation is given by

$$
\begin{equation*}
E I_{y} \frac{\mathrm{~d}^{4} u_{z}}{\mathrm{~d} x^{4}}-C_{2, z} \frac{\mathrm{~d}^{2} u_{z}}{\mathrm{~d} x^{2}}=q_{z} \tag{3-1}
\end{equation*}
$$

## Verification Example: 0003 - Cantilever Beam on an Elastic Pasternak Foundation

where the moment of inertia $I_{y}=\frac{1}{12} b h^{3}=3 . \overline{33} \times 10^{-6} \mathrm{~m}^{4}, E$ is the Young's modulus of the material and $C_{2, z}$ is the Pasternak foundation stiffness for the beam. Dividing by $E I_{y}$, (3-1) can be rewritten as

$$
\begin{equation*}
\frac{\mathrm{d}^{4} u_{z}}{\mathrm{~d} x^{4}}-\underbrace{\frac{C_{2, z}}{E_{y}}}_{\alpha} \frac{\mathrm{d}^{2} u_{z}}{\mathrm{~d} x^{2}}=\underbrace{\frac{q_{z}}{E_{y}}}_{A} \tag{3-2}
\end{equation*}
$$

where new constants $\alpha=\frac{C_{2, z}}{E I_{y}}$ and $A=\frac{q_{z}}{E I_{y}}$ were defined. The characteristic equation $\lambda^{4}-\alpha \lambda^{2}=0$ yields the following fundamental set of solutions of the characteristic equation

$$
\begin{equation*}
1, x, \mathrm{e}^{\sqrt{\alpha} x}, \mathrm{e}^{-\sqrt{\alpha} x} \tag{3-3}
\end{equation*}
$$

A particular solution of $(3-2)$ is a quadratic polynomial in the form

$$
\begin{equation*}
-\frac{A x^{2}}{2 \alpha} \tag{3-4}
\end{equation*}
$$

The solution of $(3-2)$ is then given by

$$
\begin{equation*}
u_{z}(x)=C_{1}+C_{2} x+C_{3} \mathrm{e}^{\sqrt{\alpha} x}+C_{4} \mathrm{e}^{-\sqrt{\alpha} x}-\frac{A x^{2}}{2 \alpha} \tag{3-5}
\end{equation*}
$$

Let us comptue the derivatives of (3-5)

$$
\begin{align*}
u_{z}^{\prime}(x) & =C_{2}+C_{3} \sqrt{\alpha} \mathrm{e}^{\sqrt{\alpha} x}-C_{4} \sqrt{\alpha} \mathrm{e}^{-\sqrt{\alpha} x}-\frac{A x}{\alpha}  \tag{3-6}\\
u_{z}^{\prime \prime}(x) & =C_{3} \alpha \mathrm{e}^{\sqrt{\alpha} x}+C_{4} \alpha \mathrm{e}^{-\sqrt{\alpha} x}-\frac{A}{\alpha}  \tag{3-7}\\
u_{z}^{\prime \prime \prime}(x) & =C_{3} \alpha^{\frac{3}{2}} \mathrm{e}^{\sqrt{\alpha} x}-C_{4} \alpha^{\frac{3}{2}} \mathrm{e}^{-\sqrt{\alpha} x} \tag{3-8}
\end{align*}
$$

The constants $C_{1}, C_{2}, C_{3}, C_{4}$ are determined by four boundary conditions which are required by the differential equation of the fourth order. These boundary conditions are taken as follows

$$
\begin{align*}
& u_{z}(0)=0  \tag{3-9}\\
& u_{z}^{\prime}(0)=0  \tag{3-10}\\
& u_{z}^{\prime \prime}(L)=0 \text { (zero moment) }  \tag{3-11}\\
& u_{z}^{\prime \prime \prime}(L)-\alpha u_{z}^{\prime}(L)=0 \text { (zero shear force) } \tag{3-12}
\end{align*}
$$

## Verification Example: 0003 - Cantilever Beam on an Elastic Pasternak Foundation

which yields the linear system of equations

$$
\begin{align*}
C_{1}+C_{3}+C_{4} & =0  \tag{3-13}\\
C_{2}+C_{3} \sqrt{\alpha}-C_{4} \sqrt{\alpha} & =0  \tag{3-14}\\
C_{3} \mathrm{e}^{\sqrt{\alpha} L}+C_{4} \mathrm{e}^{-\sqrt{\alpha} L} & =\frac{A}{\alpha^{2}}  \tag{3-15}\\
C_{2} & =\frac{A L}{\alpha} \tag{3-16}
\end{align*}
$$

having the solution

$$
\begin{align*}
& C_{1}=-\frac{A}{\alpha^{2}}\left[\frac{1-\sqrt{\alpha} L e^{-\sqrt{\alpha} L}}{\cosh (\sqrt{\alpha} L)}+\sqrt{\alpha} L\right]  \tag{3-17}\\
& C_{2}=\frac{A L}{\alpha}  \tag{3-18}\\
& C_{3}=\frac{A}{\alpha^{2}}\left[\frac{1-\sqrt{\alpha} L e^{-\sqrt{\alpha} L}}{2 \cosh (\sqrt{\alpha} L)}\right]  \tag{3-19}\\
& C_{4}=\frac{A}{\alpha^{2}}\left[\frac{1-\sqrt{\alpha} L e^{-\sqrt{\alpha} L}}{2 \cosh (\sqrt{\alpha} L)}+\sqrt{\alpha} L\right] \tag{3-20}
\end{align*}
$$

The final solution can then be written as
$u_{z}(x)=\frac{A}{\alpha}\left(L x-\frac{x^{2}}{2}\right)+\frac{A}{\alpha^{2}}\left[\frac{1-\sqrt{\alpha} L \mathrm{e}^{-\sqrt{\alpha} L}}{\cosh \sqrt{\alpha} L}(\cosh \sqrt{\alpha} x-1)+\sqrt{\alpha} L\left(\mathrm{e}^{-\sqrt{\alpha} x}-1\right)\right]$
where $\cosh (x)=\frac{\mathrm{e}^{x}+\mathrm{e}^{-x}}{2}$. Hence, from equation (3-21) the following maximum deflection can be deduced

$$
\begin{equation*}
u_{z, \max }=u_{z}(L)=2.991 \mathrm{~mm} \tag{3-22}
\end{equation*}
$$

while the maximum of the bending moment $M_{y}$ evaluates to

$$
\begin{aligned}
& \quad M_{y, \max }=M_{y}(0)=-E I_{y} \frac{\mathrm{~d}^{2} u_{z}}{\mathrm{~d} x^{2}}(0)=\frac{A}{\alpha}\left[\frac{1-\sqrt{\alpha} L \mathrm{e}^{-\sqrt{\alpha} L}}{\cosh (\sqrt{\alpha} L)}+\sqrt{\alpha} L-1\right]=-2.017 \mathrm{kNm} \\
& (3-23)
\end{aligned}
$$

## Plate Calculation

The theory is identical, the parameter describing the Pasternak foundation for plates $C_{2, z}$ equals to

$$
\begin{equation*}
C_{\mathrm{v}, x z}=\frac{C_{2, z}}{b}=400000 \mathrm{kN} / \mathrm{m} \tag{3-24}
\end{equation*}
$$

## Verification Example: 0003 - Cantilever Beam on an Elastic Pasternak Foundation

Note that the Poisson ratio is zero in order to approximate the member solution exactly

## RFEM 5 and RSTAB 8 Settings

- Modeled in version RFEM 5.16.01 and RSTAB 8.16.01
- The element size is $I_{\text {FE }}=0.100 \mathrm{~m}$
- Geometrically linear analysis is considered
- Isotropic linear elastic material model is used
- The Kirchhoff plate theory is used
- Shear stiffness of members is deactivated

## Results
