## Verification Example: 0034 - Torsion of a Thin Plate

## 0034 - Torsion of a Thin Plate

## Description

A thin plate is fixed on one side $\left(\varphi_{z}=0\right)$ and loaded by means of the distributed torque on the other side. At first the plate is modeled as a planar plate. Furthermore the plate is modeled as one quarter of the cylinder surface. The planar model has the same width as length of one quarter of the circle of the curved model. The curved model has thus almost equal torsional constant $J$ as the planar model. Both models are shown in Figure 1.

| Material | Steel | Modulus of <br> Elasticity | $E$ | 210000.000 | MPa |
| :--- | :--- | :--- | :--- | ---: | :--- |
|  | Poisson's <br> Ratio | $\nu$ | 0.300 | - |  |
| Geometry | Curved <br> Model Radius | $r$ | 100.000 | mm |  |
|  | Planar Model <br> Width | $s$ | 157.080 | mm |  |
|  | Plate <br> Thickness | $t$ | 3.000 | mm |  |
|  | Plate Height | $h$ | 200.000 | mm |  |
| Load | Distributed <br> Torque | $m$ | 1268.720 | $\mathrm{Nm} / \mathrm{m}$ |  |

Determine the maximum rotation of the plate $\varphi_{z, \max }$ for both geometrical models and compare the results using both Kichhoff and Mindlin plate theory.

Figure 1: Problem sketch

## Analytical Solution

The torsional constant for the planar plate (rectangular cross-section) can be calculated according to the the following formula

$$
\begin{equation*}
J=\frac{s t^{3}}{3}=1413.720 \mathrm{~mm}^{4} \tag{34-1}
\end{equation*}
$$

## Verification Example: 0034 - Torsion of a Thin Plate

Considering the same width of the planar and curved plate ${ }^{1}$ the identical torsional constant can be used ${ }^{2}$. Using torsional constant, which is calculated in (34-1), the maximum rotation on the top of the plate $(z=h)$ can be determined as follows.

$$
\begin{equation*}
\varphi_{z, \max }=\frac{m s h}{G J}=0.349 \mathrm{rad}=20.000^{\circ} \tag{34-2}
\end{equation*}
$$

Where $G$ is the shear modulus $G=\frac{E}{2(1+\nu)}$.

## RFEM Settings

- Modeled in RFEM 5.26 and RFEM 6.01
- The element size is $I_{\text {FE }}=0.002 \mathrm{~m}$
- Geometrically linear analysis is considered
- The number of increments is 5
- Plate entity is used
- Quadrangular elements are used

## Results

| Structure Files | Geometrical Model | Plate Theory | Surface Type |
| :---: | :---: | :---: | :---: |
| 0034.01 | Planar | Kirchhoff | Plane |
| 0034.02 | Curved | Kirchhoff | Quadrangle |
| 0034.03 | Planar | Mindlin | Plane |
| 0034.04 | Curved | Mindlin | Quadrangle |

| Model | Analytical | RFEM 5 |  | RFEM 6 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \varphi_{z, \max } \\ {\left[{ }^{\circ}\right]} \end{gathered}$ | $\begin{gathered} \varphi_{z, \max } \\ {\left[{ }^{\circ}\right]} \end{gathered}$ | Ratio [-] | $\begin{gathered} \varphi_{z, \text { max }} \\ {\left[{ }^{\circ}\right]} \end{gathered}$ | Ratio <br> [-] |
| Planar, Kirchhoff | 20.000 | 20.163 | 1.008 | 20.163 | 1.008 |
| Curved, Kirchhoff |  | 20.163 | 1.008 | 20.163 | 1.008 |
| Planar, Mindlin |  | 20.733 | 1.037 | 20.666 | 1.033 |
| Curved, Mindlin |  | 20.863 | 1.044 | 20.797 | 1.040 |

Remark: The results deviation is also caused by the difference between the analytical and numerically calculated torsional constant.

[^0]
[^0]:    ${ }^{1}$ The width of the planar plate is the same as length of one quarter of the circle of the curved model: $s=\frac{\pi r}{2}$.
    ${ }^{2}$ The torsional constants of the planar plate and curved plate are compared also using program SHAPE-THIN: $J_{\mathrm{p}}=$ $1396,710 \mathrm{~mm}^{4}, J_{\mathrm{c}}=1392.670 \mathrm{~mm}^{4}$.
