## Verification Example: 0007 - Orthotropic Cantilever in Tension

## 0007 - Orthotropic Cantilever in Tension

## Description

A vertical timber cantilever with fibers oriented at an angle $\beta$, with the square cross-section, is loaded at the top by the tensile pressure $p$. Base movement in the $z$-direction is restricted and always one edge of the base plane is fixed to move perpendicularly to its orientation. Assuming small deformation theory and neglecting cantilever's self-weight, determine its maximum deformation

| Material | Modulus of <br> Elasticity | $E_{x}=E_{y}$ | 3.000 | GPa |  |
| :--- | :--- | :--- | :--- | ---: | :--- |
|  |  | 11.000 | GPa |  |  |
|  | Poisson's <br> Ratio | $\nu_{x y}=\nu_{y z}=\nu_{x z}$ | 0.000 | - |  |
|  | Shear <br> Modulus | $G_{x y}=G_{y z}=G_{x z}$ | 5.500 | GPa |  |
|  | Fiber Angle | $\beta$ | -60.000 | $\circ$ |  |
| Geometry | Cantilever | Height | $h$ | 1.000 | m |
|  | Width | $b$ | 0.050 | m |  |
|  |  | Depth | $d$ | 0.050 | m |
| Load | Pressure | $p$ | 0.008 | GPa |  |

Figure 1: Problem sketch

## Analytical Solution

The applied pressure $p$ acts in a different direction than the timber fibres are oriented, therefore it is necessary to transform timber's stiffness matrix $\boldsymbol{D}_{x z}$ into the loading direction:

## Verification Example: 0007 - Orthotropic Cantilever in Tension

$$
\begin{equation*}
\boldsymbol{D}_{x z}=\boldsymbol{T}^{\top} \boldsymbol{D}_{x z} \boldsymbol{T} \tag{7-1}
\end{equation*}
$$

where $\boldsymbol{D}_{x z}$ is the stiffness 2D matrix acting in the material coordinate system $x z, \boldsymbol{D}_{x z}$ is the corresponding stiffness 2D matrix in coordinate system $X Z$ and $\boldsymbol{T}$ is the transformation matrix. The stiffness matrix in the material directions $\boldsymbol{D}_{x z}$ has the form

$$
\boldsymbol{D}_{x z}=b\left[\begin{array}{ccc}
E_{x} & 0 & 0  \tag{7-2}\\
0 & E_{z} & 0 \\
0 & 0 & G_{x z}
\end{array}\right]
$$

The transformation matrix $\boldsymbol{T}$ has the form

$$
\boldsymbol{T}=\left[\begin{array}{ccc}
c^{2} & s^{2} & s c  \tag{7-3}\\
s^{2} & c^{2} & -s c \\
-2 s c & 2 s c & c^{2}-s^{2}
\end{array}\right]
$$

where $s=\sin \beta$ and $c=\cos \beta$ respectively. The formula ( $3-1$ ) yields

$$
\begin{aligned}
& \boldsymbol{D}_{x z}=b\left[\begin{array}{ccc}
c^{4} E_{x}+s^{4} E_{z}+4 s^{2} c^{2} G_{x z} & c^{2} s^{2}\left(E_{x}+E_{z}-4 G_{x z}\right) & c s\left[c^{2} E_{x}-s^{2} E_{z}-2\left(c^{2}-s^{2}\right) G_{x z}\right] \\
& s^{4} E_{x}+c^{4} E_{z}+4 s^{2} c^{2} G_{x z} & c s\left[s^{2} E_{x}-c^{2} E_{z}+2\left(c^{2}-s^{2}\right) G_{x z}\right] \\
\text { sym. } & c^{2} s^{2}\left(E_{x}+E_{z}\right)+\left(c^{2}-s^{2}\right)^{2} G_{x z}
\end{array}\right] \\
& \\
& \\
&
\end{aligned}
$$

After that the strain 2D vector $\varepsilon$ can be easily evaluated:

$$
\boldsymbol{\varepsilon}=\left[\begin{array}{c}
\varepsilon_{X}  \tag{7-5}\\
\varepsilon_{Z} \\
\gamma_{X Z}
\end{array}\right]=\boldsymbol{D}_{X Z}^{-1} \boldsymbol{p}
$$

where $\boldsymbol{p}$ is the loading 2D vector:

$$
\boldsymbol{p}=b\left[\begin{array}{l}
0  \tag{7-6}\\
p \\
0
\end{array}\right]
$$

The maximum deflection $u_{\max }$ can be obtained according to deflections $u_{X}$ and $u_{z}$ in the $X$ and $Z$ direction respectively.

$$
\begin{align*}
u_{X} & =h \gamma_{x Z}=-1.260 \mathrm{~mm} \\
u_{z} & =h \varepsilon_{Z}=1.818 \mathrm{~mm} \\
u_{\max } & =\sqrt{u_{X}^{2}+u_{z}^{2}}=h \sqrt{\gamma_{X Z}^{2}+\varepsilon_{Z}^{2}}=2.212 \mathrm{~mm} \tag{7-9}
\end{align*}
$$

## Verification Example: 0007 - Orthotropic Cantilever in Tension

## RFEM 5 Settings

- Modeled in version RFEM 5.03.0050
- The element size is $I_{\text {FE }}=0.025 \mathrm{~m}$
- Geometrically linear analysis is considered
- The number of increments is 1
- The Mindlin plate theory is used

## Results

| Structure File | Program | Entity | Material Model |
| :---: | :---: | :---: | :---: |
| 0007.01 | RFEM 5 | Solid | Orthotropic Elastic 3D |
| 0007.02 | RFEM 5 | Plate | Orthotropic Elastic 2D |
| 0007.03 | RF-LAMINATE | Plate | - |

Figure 2: Deformation of a solid with the Orthotropic Elastic 3D material model
As can be seen from the following comparisons, an excellent agreement of analytical results with RFEM 5 outputs were achieved.

| Quantity | Analytical <br> Solution | RFEM 5 <br> Solid |  | RFEM 5 <br> Plate |  | RF-LAMINATE <br> Plate |  |
