

Program: RFEM 5, RSTAB 8

Category: Geometrically Linear Analysis, Large Deformation Analysis, Isotropic Linear Elasticity, Member

Verification Example: 0040 – Bending Console in Large Deformation

0040 – Bending Console in Large Deformation

Description

A steel console is loaded by a single force on the right end and fully fixed on the left end ($u_x = u_y = u_z = \varphi_x = \varphi_y = \varphi_z = 0$) according to the **Figure 1**. The problem is described by the following set of parameters.

| | | | | | |
|----------|------------|-----------------------|-------|---------|-----|
| Material | Steel | Modulus of Elasticity | E | 210.000 | GPa |
| | | Poisson's Ratio | ν | 0.300 | — |
| Geometry | Cantilever | Length | L | 1.000 | m |
| | | Diameter | d | 0.020 | m |
| Load | | Force | F | 1.000 | kN |

The self-weight is neglected in this example. The loading force F is remaining vertical (it is not following the free end rotation). Determine the maximum deflection of the structure $u_{z,max}$ and $u_{x,max}$ by means of the large deformation analysis.

Figure 1: Problem Sketch and Solution

Analytical Solution

The problem can be analytically solved by the Ritz's method [1]. In the first step it is necessary to choose the right approximation function. The deflection in z -direction as a multiple of the linear solution is considered

$$u_z(x) = ax^2(3l_x - x) \tag{40 - 1}$$

Verification Example: 0040 – Bending Console in Large Deformation

where a is an unknown constant. The first and the second derivative of the deflection can be calculated as

$$\frac{du_z(x)}{dx} = \varphi_y(x) = 6a l_x x - 3ax^2 \quad (40-2)$$

$$\frac{d^2u_z(x)}{dx^2} = 6a l_x - 6ax \quad (40-3)$$

In this analytical approach the axial deflection is neglected (the length of the beam stays unchanged after deformation), which yields to the following approximation according to the **Figure 2**

$$du_z = \sin \varphi_y \, dx \quad (40-4)$$

$$du_x = -(1 - \cos \varphi_y) \, dx \quad (40-5)$$

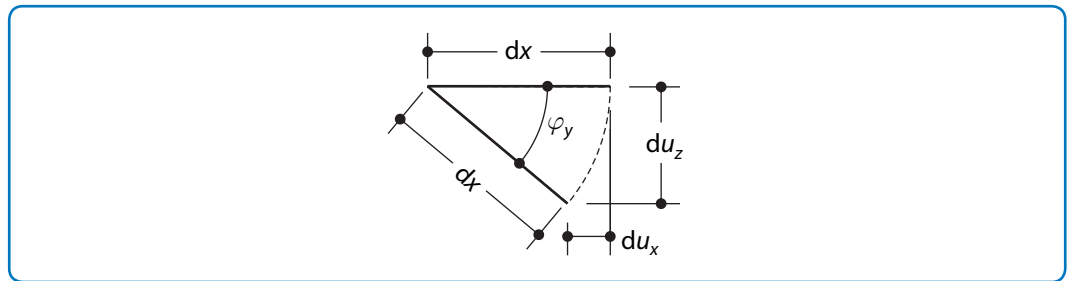

Figure 2: Deformed element

The energy of the internal forces is calculated as

$$E_{\text{int}} = \int_V \sigma \varepsilon \, dV = \frac{E l_y}{2} \int_{l_x} \left(\frac{d^2u_z(x)}{dx^2} \right)^2 dx = 6a^2 l_x^3 E l_y \quad (40-6)$$

where l_y is the quadratic moment of the cross-section to the y -axis¹. The energy of the external forces is calculated as

$$E_{\text{ext}} = -F \int_{l_x} du_z = -F \int_{l_x} \sin \frac{du_z(x)}{dx} dx \quad (40-7)$$

In the following calculations the Taylor's polynomial series for the sine and cosine function at the point $x = 0$ is used.

$$\sin \varphi_y(x) = \varphi_y(x) - \frac{\varphi_y^3(x)}{3!} + O(\varphi_y^5(x)) \quad (40-8)$$

$$\cos \varphi_y(x) = 1 - \frac{\varphi_y^2(x)}{2!} + \frac{\varphi_y^4(x)}{4!} + O(\varphi_y^6(x)) \quad (40-9)$$

¹ $l_y = \frac{\pi d^4}{64} = 7854.000 \text{ mm}^4$

Verification Example: 0040 – Bending Console in Large Deformation

$$E_{\text{ext}} \approx -F \int_{l_x} \left(\frac{du_z(x)}{dx} - \frac{\left(\frac{du_z(x)}{dx}\right)^3}{6} \right) dx = F \left(\frac{72}{35} a^3 l_x^7 - 2a l_x^3 \right) \quad (40 - 10)$$

The total potential energy is then

$$II = E_{\text{int}} + E_{\text{ext}} = 6a^2 l_x^3 E I_y + F \left(\frac{72}{35} a^3 l_x^7 - 2a l_x^3 \right) \quad (40 - 11)$$

The unknown constant a is gotten by the principle of the minimum total potential energy of the system

$$\frac{dII}{da} = 0 \quad (40 - 12)$$

$$12a l_x^3 E I_y + F \left(\frac{216}{35} a^2 l_x^7 - 2l_x^3 \right) = 0 \quad (40 - 13)$$

$$a_1 = 9.805265 \cdot 10^{-8} \quad a_2 = -3.305102650 \cdot 10^{-6}$$

The first solution a_1 is taken further. Due to the large deformations it is necessary to calculate both deflections by means of following integration. Taylor's polynomial series for the sine and cosine function is used again.

$$u_{z,\text{max}} = \int_0^{l_x} du_z = \int_0^{l_x} \sin \varphi_y(x) dx = 194.166 \text{ mm} \quad (40 - 14)$$

$$u_{x,\text{max}} = \int_0^{l_x} du_x = - \int_0^{l_x} (1 - \cos \varphi_y(x)) dx = -22.948 \text{ mm} \quad (40 - 15)$$

RFEM 5 and RSTAB 8 Settings

- Modeled in RFEM 5.04.0024 and RSTAB 8.04.0024
- The element size is $l_{FE} = 0.100 \text{ m}$
- Large deformation analysis is considered
- The number of increments is 5
- The structure is modeled using members
- Shear stiffness of the members is neglected
- Isotropic linear elastic material model is used

Results

| Structure File | Program |
|----------------|---------|
| 0040.01 | RFEM 5 |
| 0040.02 | RSTAB 8 |

Verification Example: 0040 – Bending Console in Large Deformation

| | Analytical Solution | RSTAB 8 | Ratio | RFEM 5 | Ratio |
|-------------------|---------------------|---------|-------|---------|-------|
| $u_{z,\max}$ [mm] | 194.166 | 194.241 | 1.000 | 194.240 | 1.000 |
| $u_{x,\max}$ [mm] | −22.948 | −22.935 | 0.999 | −22.887 | 0.997 |
